

JUNE, 1920.

CLIMATOLOGICAL DATA: CALIFORNIA SECTION.

49

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

CALIFORNIA SECTION.

EDWARD A. BEALS, METEOROLOGIST.

Vol. XXIV. SAN FRANCISCO, JUNE, 1920.

No. 6.

GENERAL SUMMARY.

Unseasonable and changeable weather prevailed in California during June. The principal features consisted of abnormal rains from the 13th to the 15th, a hot spell from the 18th to the 24th, a few cold nights, and many days of hot, desiccating northerly winds. At Fresno the highest temperature in nine years, 110°, occurred on the 20th. On the same day a temperature of 108° was recorded in Sacramento, a new high record for a month of June at that place. On the other hand, temperatures much below freezing were recorded during the early portion of the month in the elevated regions. An extraordinary rainfall of almost five inches was received at Crescent City on the 7th. Light snow fell during a thunderstorm at La Porte, Plumas County, on the 29th. All streams continued to fall during the month. On the 25th the Sacramento River at Colusa reached the lowest stage ever recorded there. Because of the deficient precipitation of the past rainy season throughout the northern half of California, it is expected that streams in that portion of the State will continue to fall during the summer, probably to unprecedented low stages. Snow in the Sierra Nevada Mountains disappeared much earlier than in past years. More sunshine than is usual during June was received along the coast.

All growing crops were influenced by freakish weather. These conditions did not improve the outlook for field crops, which, generally speaking, are far below normal. At the close of the month the condition of winter wheat, oats, barley, grass, and alfalfa was lower than that of the same date last year, as all were injured by the deficient precipitation of the spring months. Though pastures were only fair, grazing stock maintained good condition. The deciduous fruit crop is not as promising as was indicated by conditions on the same date last year. Rains on the 14th and 15th damaged the maturing cherry crop, causing the fruit to crack badly. The deficient precipitation of the spring months injured prunes, plums, apples, and pears. Grapes, particularly raisin and table varieties, were damaged by the hot wave. The condition of nut crops, especially walnuts, improved. The June drop of oranges was light, but the abrupt rise in temperature which culminated in the hot spell caused the condition of all citrus fruits to deteriorate somewhat. While the condition of cotton at the close of June was not so good as that of the same date last year, the acreage planted was considerably larger. Beans were in fair condition at the close of the month, but the acreage was somewhat less than last year. Sugar beets made satisfactory progress, and there is a prospect of a larger crop than that of last year.

A. H. P.

PRESSURE.

The mean sea-level pressure, determined from the records of 12 regular Weather Bureau stations, was 29.96 inches. The highest was 30.28 inches at Eureka on the 8th; the lowest was 29.48 inches at Independence on the 9th; the range for the State was 0.80 inch.

TEMPERATURE.

The monthly mean temperature for the State, as shown by the records of 98 stations, was 67.3°, which is 1.7° below the normal.

The highest monthly mean was 92.0°, at Greenland Ranch; and the lowest was 50.0°, at La Porte.

The highest temperature, 120°, occurred at Greenland Ranch on the 21st; and the lowest, 20°, occurred at Portola on the 8th.

The range for the State was 100°.

PRECIPITATION.

The average precipitation for the State, as shown by the records of 240 stations, was 0.42 inch, or 0.11 inch above the normal.

The greatest monthly amount was 7.49 inches, at Crescent City. No rain fell at 58 stations.

The greatest amount in 24 hours was 4.87 inches at Crescent City on the 7th.
