

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.  
CHARLES F. MARVIN, Chief.

# CLIMATOLOGICAL DATA.

## CALIFORNIA SECTION

EDWARD A. BEALS, METEOROLOGIST.

Vol. XXV.

SAN FRANCISCO, JULY, 1921.

No. 7.

## GENERAL SUMMARY.

Seasonable weather prevailed in California during July. It was cool and foggy along the coast, and hot and dry in the interior. For the State as a whole the mean temperature for the month was exactly normal. Several hot spells occurred during which temperatures above 100° were recorded in the Sacramento-San Joaquin Valley, and temperatures above 110° in the southeastern desert region. Abundant sunshine was received in the interior valleys. Thunderstorms accompanied by little or no precipitation were frequent in the Sierra Nevada Mountains. The only rain of consequence was that which fell during violent local thunderstorms in the mountains of San Diego County on the 12th, 15th and 20th. Unusually heavy showers in the vicinity of Campo, San Diego County, on the 20th, caused a local flood which resulted in some slight damage. Field and forest fires were numerous in the central and northern portions of the State. Sufficient water was available for the generation of hydroelectric power. Wind movement was light.

Agriculturally, the weather during July was favorable. Irrigation water was ample, and most growing crops made excellent progress toward maturity. During the first week hot, desiccating winds caused some damage to fruit and grain, however. Immature fruit dropped from the trees in larger amounts than is usual during July. Nevertheless, both citrus and deciduous fruits progressed satisfactorily. Apricots, plums, peaches and figs were harvested, and the yields were normal, both in quality and quantity. The harvesting of grain crops was completed; wheat, barley and oats showed the effects of the hot spells in that they matured too rapidly. But the hot weather was good for corn, rice, hops, grapes, walnuts, sugar beets, cotton and alfalfa, all of which crops showed excellent growth. Lowland pastures dried up, but mountain ranges furnished ample feed for grazing stock. Field beans growing along the coast were somewhat backward during the early part of the month, but they improved under the persistent fog. Olives growing in southern California made poor progress. Near the close of the month grapes, pears and apples appeared in the markets. At the close of the month most growing crops were in a satisfactory condition, and there was every indication of normal crops, both in quality and quantity. A.H.P.

## PRESSURE.

The mean sea-level pressure, determined from the records of 11 regular Weather Bureau stations, was 29.92 inches. The highest was 30.20 inches at Eureka on the 15th; the lowest was 29.61 inches at Independence on the 2nd; the range for the State was 0.59 inch.

## TEMPERATURE.

The monthly mean temperature for the State, as shown by the records of 98 stations, was 74.0°, which is exactly normal.

The highest monthly mean was 102.0°, at Greenland Ranch; and the lowest was 53.4° at Point Reyes.

The highest temperature, 123°, occurred at Greenland Ranch on the 1st and 8th; and the lowest, 24°, occurred at Portola on the 10th.

The range for the State was 99°.

## PRECIPITATION.

The average precipitation for the State, as shown by the records of 243 stations, was 0.05 inch, or 0.01 inch above the normal.

The greatest monthly amount was 5.30 inches, at Campo. No rain fell at 189 stations.

The greatest amount in 24 hours was 2.90 inches at Campo on the 20th.
