WEATHER BUREAU

CLIMATOLOGICAL SERVICE

DISTRICT No. 10, GREAT BASIN

ALFRED H. THIESSEN
DISTRICT EDITOR

REPORT FOR JULY, 1913

Prepared under direction of C. F. MARVIN, Chief U. S. Weather Bureau

WASHINGTON
GOVERNMENT PRINTING OFFICE
1913

CLIMATOLOGICAL DATA FOR JULY, 1913.

DISTRICT NO. 10, GREAT BASIN.

ALFRED H. THIESSEN, Section Director.

GENERAL SUMMARY.

July was unusually cool and wet. The temperatures for the district as a whole averaged as low as any on record for July, excepting in 1897, 1902, and 1912. The precipitation was the heaviest for July on record in the Nevada area, and in the Utah area it was nearly as heavy as in July, 1912, the rainfall in which month was exceeded only in July, 1896.

From an agricultural viewpoint the month was very favorable. The frequent showers were beneficial to dry farms and kept the ranges green, but some damage to hay was reported. There was an unusual number of cloudbursts during the month, which added materially to the irrigation water supply. In Nevada the cloudbursts and excessive rainfall caused train delays by washing out the roadbed both on the Southern Pacific and Western Pacific Railroads. There was also considerable damage to private property.

TEMPERATURES.

The temperature for the district averaged 67.6° , which is 3.3° below normal, and the individual means varied from 53.8° at Park City, Utah, to 82.4° at Jean, Nev. The temperature chart shows that the highest means occurred in the more level counties in the Utah area and in the southern half of the Nevada area. The lowest means were observed in the Wyoming area and in the more elevated portions of the Utah area.

The deficiencies of temperature were very large at a few stations. At Kelton, Utah, the mean was 65.4° , being 11.6° below normal; at Tecoma, Nev., the mean was 63.4° , being 10.8° below normal, and at Beowawe, Nev., the mean was 66.5° , or 10.7° below normal. The excesses in the monthly mean temperature were very few, the greatest being 2.8° at Burns, Oreg.

The temperatures during the first half of the month were near the normal, with the exception of the 5th, 6th, and 7th, when the weather was abnormally warm and the highest temperatures of the month were generally observed.

After the 10th the weather grew cooler at many places, becoming generally so on the 12th; and the lowest temperatures for the month were recorded at a majority of stations during the period from the 10th to the 14th.

Although the mean temperatures averaged considerably below normal, nearly all stations reported maximum temperatures of 90° or above, and at 11 stations temperatures of 100° or over were observed. The highest temperatures that occurred in the various states having areas in this district were as follows: 88° at Border, Wyo., on the 6th; 98° at Grace, Idaho, on the 6th; 103° at Low, Utah, on the 10th; 95° at Burns, Oreg., on the 25th; 88° at Bridgeport, Cal., on the 5th and other dates; and 110° at Jean, Nev., on the 11th.

Temperatures of 32° or below occurred in all the areas of the several States in this district except Idaho. As these low temperatures occurred at the more elevated stations, no damage to tender crops resulted. The lowest temperatures were: 30° at Cokeville, Wyo., on the 12th; 34° at Paris, Idaho, on the 2d, 4th, and 29th; 21° at Park City, Utah, on the 7th; 25° at Cliff, Oreg., on the 13th; 32° at Bridgeport, Cal., on the 16th; and 26° at Wells, Nev., on the 14th.

PRECIPITATION.

The monthly precipitation ranged from as high as 7.06 inches at Park City to a trace at Farmington and Corinne, all in Utah. The average for the district as a whole was 1.40 inches, or 0.89 inch above the normal. The rainfall was well distributed, there being only a few stations having deficient amounts, while many reported several times their normal amounts.

The rainfall in the Nevada area was particularly heavy, and the section director of that State writes:

The average precipitation for the Nevada area was 1.52 inches, which is six times the normal amount. Tonopah reported 0.16 inch, and is the only station having less than the normal. In the northern section amounts ranged from 0.27 inch at Gerlach to 4.51 inches at Golconda. In the middle section amounts ranged from 0.16 inch at Tonopah to 2.36 inches at Potts. In the southern section the amounts ranged from 0.95 inch at Oasis Ranch to 1.48 inches at Lida. The heaviest precipitation in 24 hours was 2 inches at Golconda on the 22d. Seven places in the State reported over 1 inch in 24 hours. Because of the mountainous character of the country rains did a great deal of damage to roads and railroads, causing washouts and landslides, making the roads impassable and delaying train service many hours in some instances. A large amount of alfalfa hay was spoiled, but ranges are in excellent condition.

The largest 24-hour amount of rainfall in the district was 2.22 inches at Park City, Utah, on the 18th.

The greater portion of the rain fell from the 15th to the 28th. There was also scattering showers on various dates from the 3d to the 10th in all areas excepting California.

MISCELLANEOUS PHENOMENA.

The average number of clear days for the district is 15, partly cloudy days 10, cloudy days 6, and rainy days 6.

The observer at Morgan, Utah, reported a terrific thunderstorm in the vicinity of his station on the 23d, which did considerable damage to crops and property.

The observer at Showell, Utah, reported a severe thunderstorm on the 26th, which damaged grain and gardens.

Mr. Charles Pratt, of North Fork, Nev., reported that rains from 18th to 28th spoiled considerable hay.

Mr. C. M. Carter, of Smith, Nev., reported that the July rains did more damage than good, that hundreds of tons of hay were spoiled, ditches were filled with mud, obstructing the flow of water, and that the second crop of alfalfa was yellow from too much water.

DISTRICT NO. 10. CLIMATOLOGICAL SUMMARY.

JULY, 1913

TABLE 1.—Climatological data for July, 1913. District No. 10, Great Basin.
