

# CLIMATOLOGICAL DATA NEVADA

JUNE 1994  
VOLUME 109 NUMBER 6

## MONTHLY PRECIPITATION DEPARTURE FROM INDIVIDUAL STATION NORMALS (1961-1990)

- M INCOMPLETE DATA FOR THE MONTH
- v EXACTLY NORMAL
- ○ 5,10,20... 50% OR MORE BELOW NORMAL
- ● 10,20,40...100% OR MORE ABOVE NORMAL

CIRCLE DIAMETER IS PROPORTIONAL TO DEPARTURE ON A CONTINUOUS SCALE

"I CERTIFY THAT THIS IS AN OFFICIAL PUBLICATION OF THE NATIONAL OCEANIC AND ATMOSPHERIC ADMINISTRATION (NOAA). IT IS COMPILED USING INFORMATION FROM WEATHER OBSERVING SITES SUPERVISED BY NOAA/NATIONAL WEATHER SERVICE AND RECEIVED AT THE NATIONAL CLIMATIC DATA CENTER (NCDC), ASHEVILLE, NORTH CAROLINA 28801."

# REFERENCE NOTES

NEVADA  
JUNE 1994

## DEFINITIONS

**STATION NAMES:** Name of the city, town or locality. Figures and letters following the station names indicate the distance in miles and direction from the post office or town community center.

**DIVISIONS:** Areas within a state of similar climatological characteristics. Division averages are calculated using data from stations that record both temperature and precipitation (i.e. not precipitation alone).

**NORMALS:** The average value of the meteorological element over a time period. Effective 1 January 1993, the averaging period is 1961 to 1990. The normals for National Weather Service localities have been adjusted so as to be representative for the current observation site.

**MONTHLY DEGREE DAY TOTALS:** One heating (cooling) degree day is accumulated for each whole degree that the daily mean temperature is below (above) 65 degrees Fahrenheit.

**PRECIPITATION:** Values shown in hundredths of inches are water equivalent totals, i.e., total of liquid and melted frozen precipitation. In the "Monthly Summarized Data" table the total snow and sleet values shown in tenths of inches are unmelted amounts. The max depth on ground values of snow and sleet shown in whole inches are cumulative unmelted amounts. The number of days with .10, .50, 1.00 or more refers to water equivalents.

**TEMPERATURE:** Original and edited temperature values are given in the "Daily Temperature" table. Edited values are produced when an original value is missing or when surrounding stations indicated a suspect original value. When a line labeled OBS is present and contains either a daily temperature (suspect) or \*\*\* (missing), the temperature appearing directly above, on the line labeled MAX or MIN, is an edited value. Summary temperature information (averages, departures, extremes, monthly degree day totals) is based on the values labeled MAX/MIN.

**WIND:** (As shown in the "Evaporation and Wind" table) the total wind movement in miles over the evaporation pan as determined by an anemometer recorder located 6-8 inches above the pan.

## SYMBOLS AND LETTERS USED IN THE STATION INDEX TABLE

# Thermometers located in a rooftop shelter.  
// Rain gage equipped with a windshield  
AR Observation made "after rain" has occurred.  
C Station is equipped with recording rain gage (R) but values in this bulletin are from a non-recording rain gage unless indicated by an R.  
G Observations appear in the "Soil Temperatures" table.  
H Observations appear in the "Snowfall and Snow on the Ground" table.  
J Station also published as a Local Climatological Data publication.  
MID Observation time is midnight.  
MO Rain gage read once monthly, usually the last day.  
OC Rain gage readings vary from a few weeks to several months.  
R Amounts from recording rain gage.  
SR Observation time near sunrise.  
SS Observation time near sunset.  
VAR Observation time varies.  
WI Rain gage read weekly or irregularly.  
WM Rain gage read weekly and last day of the month.

## SYMBOLS AND LETTERS USED IN THE DATA TABLES

(DAILY DATA ARE FOR THE 24 HOURS IMMEDIATELY PRECEDING OBSERVATION TIME.)  
BLANK Entries in the "Monthly Summarized Data" table indicate no record.  
BLANK Entries in the "Daily Precipitation" and "Snowfall and Snow on the Ground" tables indicate zero.  
BLANK Entries in the "Daily Temperature" table indicate a missing record where an edited value could not be determined. (See \*\*\* below)  
- No record. Data not recorded, determined unreliable by quality control check, or not received in time for publication.  
+ Precipitation or temperature extremes occurred on one or more previous dates during the month.  
\*\*\* Missing original temperature which has been estimated during edit.  
\* Rain gage not read. Precipitation is included in the amount following the asterisks. Time distribution not known. A \* preceding the monthly total indicates precipitation amount is being carried forward to next months total, and may include amounts from the previous month(s).  
// Rain gage equipped with a windshield.  
A Amount of precipitation is the total of observer's entries for the current month. It may include precipitation that occurred during the previous month. Refer to earlier bulletin to determine date of last reading. (Hawaii stations)  
B Adjusted monthly value (estimated), (1-7 missing values for wind and evaporation).  
M Insufficient or partial data. M is appended to average and/or total values computed with 1-9 daily values missing. M appears alone if 10 or more daily values are missing, (8 or more for wind and evaporation).  
R Amounts from recording rain gage.  
T Trace. An amount too small to measure.  
V Includes total for previous month(s). (See \* above)

**SEASONAL TABLES:** Monthly and seasonal snowfall and heating degree days for the 12 months ending with the June data are published in the July issue of this bulletin. Cooling degree days for the calendar year are published in the "Climatological Data Annual Summary."

The graphic displays appearing in this publication were first produced for the January 1987 data month. The types of graphs and the information they portray may vary from month to month and from state to state in order to highlight climatic features of state, regional, and seasonal interest. Some graphs present information for "clusters". A cluster is a group of up to four adjacent divisions that comprise an area of similar climate.

Information concerning the history of changes in locations, exposure, etc. of substations is kept on file at the National Climatic Data Center. Historical information of regular National Weather Service Offices may be obtained from the "Local Climatological Data" annual publication. The contents of this publication may be reprinted or otherwise used freely, with proper credit to the National Climatic Data Center. The data are also available in digital form on magnetic tape and diskette.

SPECIAL WEATHER SUMMARY

John W. James  
State Climatologist  
Mackay Science Hall  
University of Nevada-Reno  
Reno, NV 89557

SYNOPSIS

Hallelujah! At long last the 122° all-time Nevada State high temperature, set at several locations on many occasions in June and July, has been surpassed and not just barely! On the 28th Laughlin reached 124° at the official Clark County Fire Department location, bubbling up to 125° on the 29th, then falling back to 123° on the 30th. Early morning temperatures on those days were in the mid 80s. During the 9-day period from June 24th to July 2nd the maximum never fell below 120°, averaging a blistering 122°. Nearby, Cottonwood Cove reached 124°, with 122° at Overton, and 121° at Callville Bay and Echo Bay.

At Death Valley N.P. the mercury reached 128°, after an early morning low of only 101°! It was also 128° there in July

1972. The all-time U.S. high of 134°, recorded at Death Valley in July 1913, is suspect as there has not been a reading above 128° since then. However, the record is still accepted, for lack of knowledge about atmospheric conditions, instruments, and observer techniques 80 years ago.

Statewide June was also unusually dry, with only a few showers and thunderstorms in the extreme north and northeast early in the month. Most of Nevada's climate observers reported no precipitation this month. Water Year precipitation is near normal at most locations except for far western and southern Nevada, where it is far below normal. In the Far West 7 of the last 8 years have had below normal precipitation for the driest conditions in over 100 years, as the drought continues unabated. Wild vegetation and

streamflow conditions are at/near record dry levels, with no end in sight.

### TEMPERATURE

Departures from average temperatures were above normal over most of the State, being in the +3 to 5° range at many locations. This is the fourth month in a row with warm temperatures. Only parts of the northeast were a little below long-term normals.

In addition to the new all-time statewide high temperature at Laughlin other locations also set or neared records for June. Overton reached 122°, tying the June and annual high with records since 1906. It was the hottest June in Las Vegas since NWS records began at the airport in 1937, (+6°) although the June maximum of 116° set in 1940 still stands, as does the 117° in July of 1942, and the pre-airport record of 118° recorded by Charles "Pop" Squires, Las Vegas long-time weather observer (1908-1957), in July 1931. Three straight days of 115° at McCarren International Airport this year neared the 3-day record of 117, 115, and 118° of July 24th through the 26th, 1931. At Caliente the 107° beat the June record set in the very hot 1954 heat spell. The record is 85 years long. It was also 108° at Searchlight, just 2° shy of the June 1954 record, with 80 years of data logging. Desert NWR at Corn Creek tied the June record of 112° set in 1970, with data first collected 50 years ago.

On the cool side, Charleston dropped to 14° on the 14th, with several mornings below 20°, while nearby Boies Ranch had 21°. Truckee, CA dropped to 15° the same day. Charleston had another "sweater-shorts" day with an AM low of 22° and a PM high of 88° on the 30th. Grabbing another such day out of history, Battle Mountain had a low of 31° and a high of 100° on July 3rd, 1909, with 11 to 85° at Charleston on September 19, 1962, and 3 to 75° on October 19, 1967, at the same place.

### PRECIPITATION AND EVAPORATION

Most of Nevada had no precipitation this month. Only a few spots in the northeast and extreme north recorded rain early in the month. Ruth had 0.90 inch, Vya 0.58 inch, Cedarville, CA 0.53 inch, Jackpot 0.38 inch, and McGill 0.31 inch. All others that recorded any rain had less than 0.25 inch.

Water deficits built up as evaporation were well above normal for June. For example, Overton had 19.25 inches of pan evaporation and a normal of only 14.69 inches, Boulder City logged 23.29 inches, a new June record in 60 years of record, and 7 inches above normal. Ruby Lake had 12.04 inches; and a normal of 8.98 inches, with Fallon at 10.32 inches and a normal of 9.20 inches. Honey Lake had 10.15 inches, 2 inches over normal. In addition, Minden had 10.57 inches, Shoshone 9.69 inches, and Pahranaagat NWR 12.35 inches.

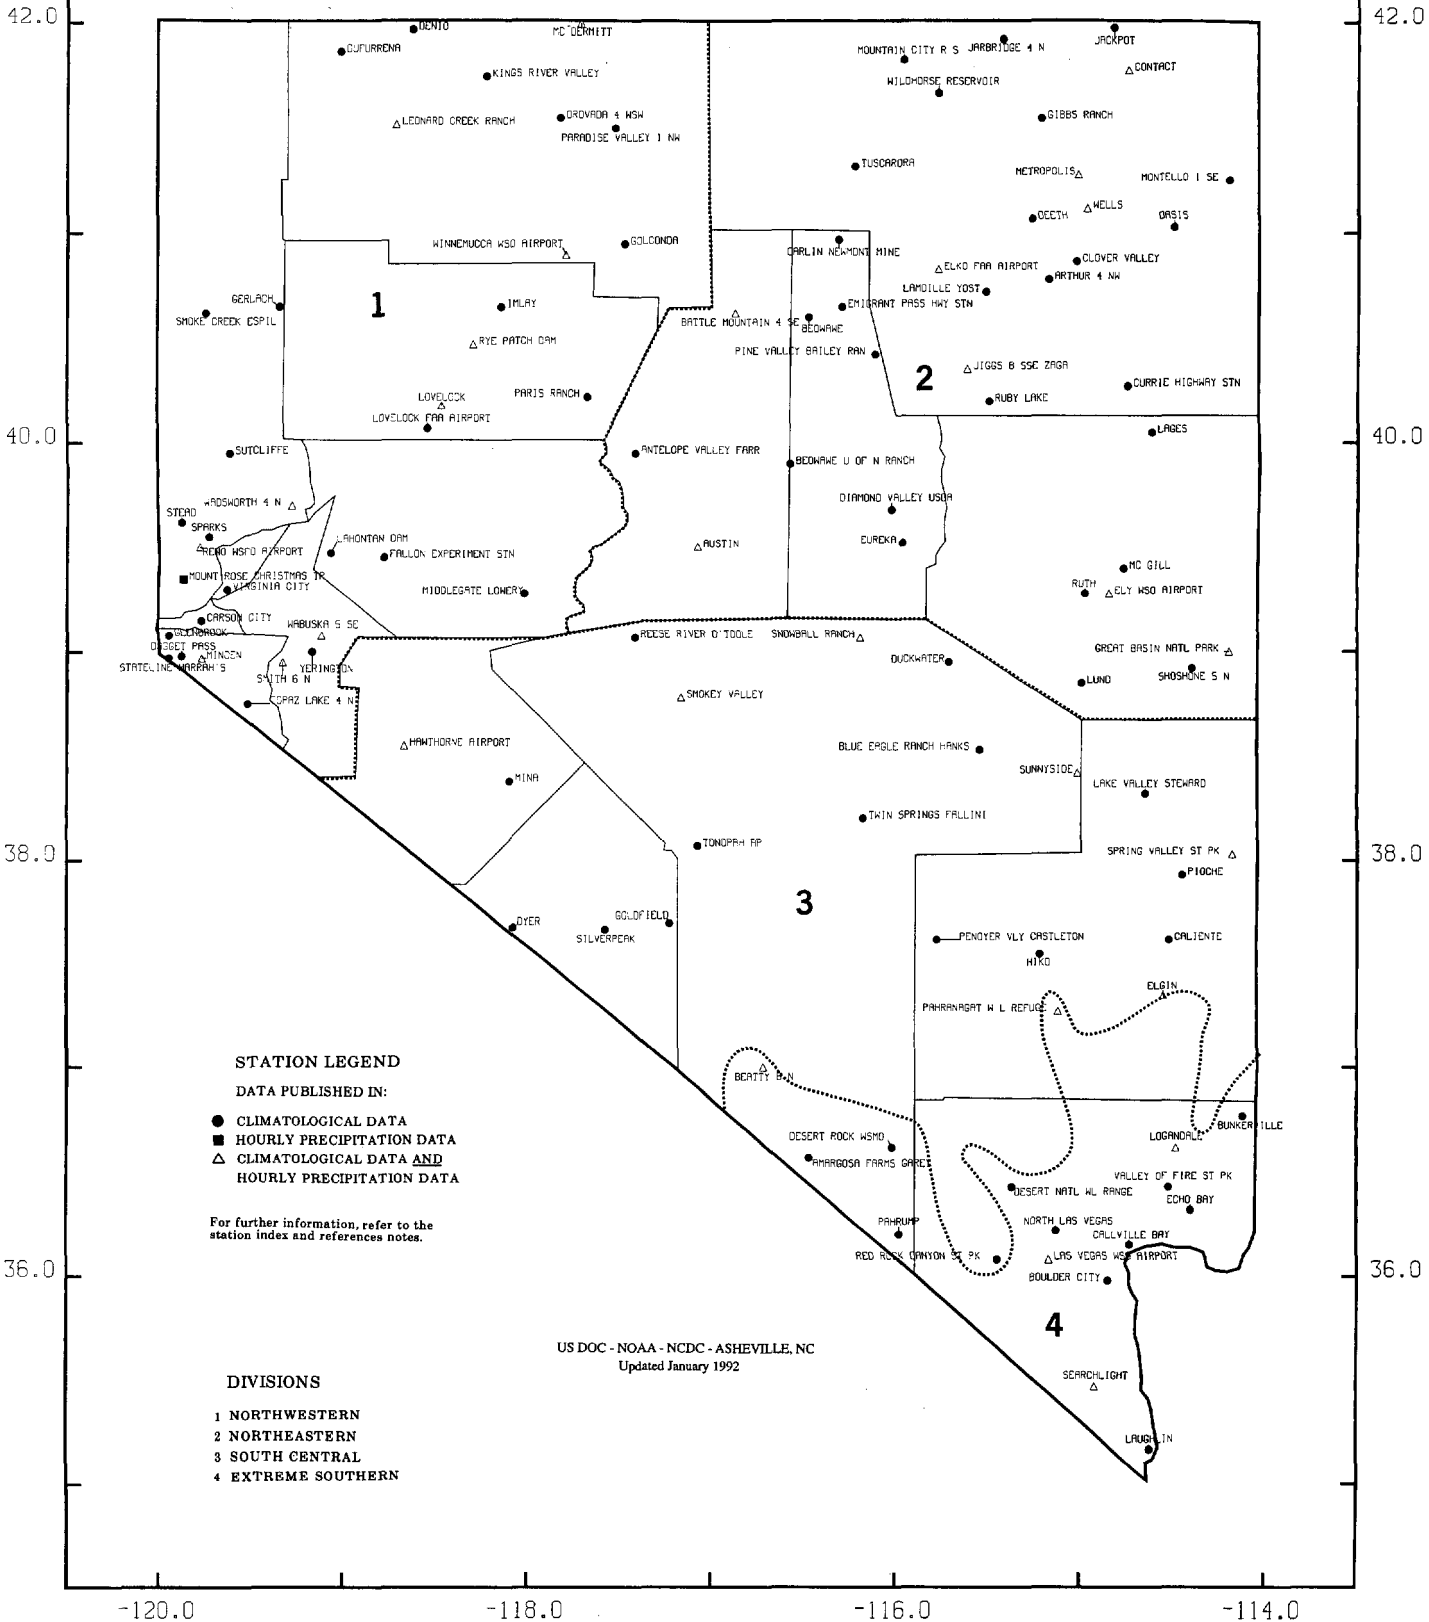

### SUNSHINE AND WIND

The lack of storms and cloudiness led to an unusually sunny month with 85 to 95% of the possible sun hours statewide, with the highest total in the south.

It was also a windier than normal month. This coupled with high temperatures and lots of sun, led to unusual drying of range lands, especially in the west and south.
